

Models: Recipe, Ingredient (and User is built-in)

Change: Added `image` field to Recipe so each recipe can store a photo

This unit says that there needs to be images implemented and image support as well as an upgrade to the previous UI

Reflection Questions

1. In your own words, explain Django static files and how Django handles them.

Static files are things like images, CSS, and JavaScript that don't change when the page loads. They're not generated dynamically like data from the database. Django keeps track of where these files are using settings like `STATIC_URL` and `MEDIA_URL`. During development, Django can send them up automatically, but in production they're usually handled by a web browser. In this exercise san project, recipe images are treated as media files and stored in a folder that is hosted by django.

2. **ListView and DetailView**

ListView

ListView is a class based view that automatically displays a list of objects from a model. For example, in the recipe app, it could be used to show all recipes on one page without writing a lot of custom code. It handles querying the database and sending the results to a template. Its very helpful.

DetailView

DetailView is used to show one specific object from a model. For example, it can display the full details of one recipe when a user clicks on it. It automatically looks up the object by ID and sends it to the template. It saves time because a lot of the logic is already built in.

3. **Reflection on learning so far**

Overall, the nature of the last week has been hectic and scary- not to mention stressful so I am trying the best I can given the insolvency proceedings and the 10 day notice of contract termination. That being said, I feel more comfortable understanding how Django connects models, views, and templates together. I'm proud that I've built a working web application from scratch and connected it to a database with images and dynamic pages.

What I still struggle with sometimes is understanding how everything connects behind the scenes, what the individual building blocks are and more basic things since I haven't spent as much time as I traditionally would have going through those basics I also need more practice with writing clean tests and using class-based views. But overall, I can see the progress, and things are starting to make more sense as I build more features.
